SYNTHETIC EVALUATION FIXTURE - NOT A REAL DOCUMENT

Coastal Weather Manual (Synthetic)

Left column, page 1:

The lighthouse wind gauge at Cape Aurora records a mean annual wind speed of 18.4 knots, the highest in the fictional register. Fog descends on the cape on an average of 41 days per year, almost all of them in the fictional winter months.

Right column, page 1:

The ferry crossing between Hale and the outer harbour is suspended when sustained winds exceed 35 knots, a limit taken from the fictional coastal safety code, table S-7.

The synthetic tide table for Hale lists a mean range of 2.7 metres, distinct from the 3.2 metres recorded at Port Meridian.

Left column, page 2:

Radio channel 16 is monitored continuously by the fictional harbour authority during the synthetic storm season.

The storm season log records a fictional gale of 31 hours at the outer harbour, the longest entry in the synthetic register.

Right column, page 2:

The outer harbour fog signal sounds every 30 seconds during reduced visibility, per the synthetic sailing directions.

End of page 2 of the synthetic coastal weather manual.
